A DEFINITION OF HUMAN REPRODUCTIVE ECOLOGY

First, we want to define what we mean by “Human Reproductive Ecology” and what we saw as the impetus for this meeting.

Following the dictionary and several of our proposal reviewers, we define human reproductive ecology as: *the study of the relationships among human prerative decisions, fecundity, fertility, and the biotic and abiotic conditions surrounding humans.* Ultimately, that global definition means that human reproductive ecology can utilize the information gleaned by a large number of social, biomedical, and environmental disciplines and can equally contribute to them. It can serve as a bridge for communication among researchers who often have difficulty speaking each other’s scientific languages. And it can serve as an important contributor to other global undertakings such as the Human Genome Project, the Women’s Health Initiative, the establishment of sustainable global development, or the design of effective global environmental policy.

Much has been said and written about man’s affect on his environment yet we know precious little about the environment’s affect on man, including his ability to reproduce. Human fertility in contemporary industrialized nations is low, largely, though probably not entirely, due to use of contraceptives. As humans have historically demonstrated higher fertility, this situation is recent and unique. Its existence poses a number of important medical questions that arise because our present reproductive physiology did not evolve to function optimally in our modern, technical, urbanized environment. For example, are high levels of fetal loss and widespread pathological sterility inherently human traits, or are they recent developments in the evolution of our biology? Have we jeopardized our innate ability to reproduce by our conquest of our environment? What can we learn about human reproduction from preindustrial populations? In non-industrialized regions such as sub-Saharan Africa, persistent high fertility and rapid population growth are associated with deteriorations of both the biotic and abiotic environments. The epidemiological consequences of such environmental deterioration are a rapidly growing facet of medical treatment and

Sperms and eggs are collectively described as gametes, and are specialised cells in which recombination and halving of the genetic material has taken place by a special sequence of cell division called meiosis. O. Lopez teaches human reproductive biology through the Department of Integrative Physiology at the University of Colorado-Boulder. The book offers both broad and specific knowledge in areas that have advanced the field in recent years, including advances in cell and molecular biology applied to reproduction, transgenic animal production, gender selection, artificial insemination, embryo transfer, cryobiology, animal cloning and many others. In 1990 he received the Student Organization for Alumni Relations Teaching Recognition Award for his teaching of an annual undergraduate course, Human Reproductive Biology, and a course on human anatomy.
